In a paper published in *Nature*, a team led by **Witold Nazarewicz**, professor of physics, used the Jaguar high-performance computer to assess the theoretical boundaries of possible nuclei that could exist. The paper, "The Limits of the Nuclear Landscape," indicates that some 6,900 nuclei are theoretically possible, more than twice the number that exist in nature or that have been synthesized in laboratories. Other authors of the paper included postdocs **Jochen Erler** and **Markus Kortelainen**, graduate student **Erik Olsen**, undergraduates **Noah Birge** and **Alex Perhac**, and the late **Mario Stoitsov**, a UT research professor.

Stefan Spanier, associate professor of physics, as well as postdoc **Zongchang Yang**, graduate students **Grant Riley** and **Andrew York**, and recent physics graduates **Giordano Cerizza** and **Matthew Hollingsworth**, played a role in the research that led to the recent announcement of the observation of the Higgs boson. Spanier's group worked on detectors that safeguarded crucial equipment in the Large Hadron Collider.

Fourth-year architecture student **Asia Dixon** of Nashville won one of two Gensler African American Scholarships from Gensler, a global architecture firm. Her award includes support for her fifth year of school and a paid summer internship.
