OVERVIEW & TOP FINDINGS

The purpose of this research is to identify any usability issues and opportunities to improve the design for superb communication of volcanic hazards and risks. From this research, insights into the intuitiveness and risk-communication deficiencies of these hazard maps will help create a new methodology for evaluation map-based communication products implemented by USGS and its partners/stakeholders, Risk COP members, and practitioners around the world to alleviate volcanic risk and hazards.

This study utilized three previously developed hazard maps for Newberry Volcano, Lassen Volcanic Center, and Crater Lake (Image 1, 2, 3). Each of the maps was evaluated through a usability test to determine how well the communication objective for risk-communication was met and measure utility. From this evaluation, the study also looks to pinpoint the user's needs and opportunities for design changes that allow for greater risk-communication. Furthermore, the study gathered feedback from eleven students from the University of Tennessee. They were divided into two groups (Group 1 and Group 2). Each group was shown three volcano hazard maps and asked similar questions and tasks, but each group viewed a video of a lahar hazard in Japan at different times (Participants viewed the video on a separate web page, but this is the video as available through YouTube: https://www.youtube.com/watch?v=kznwnpNTB6k). The idea was to evaluate not only the usability of the volcano hazard maps but to see how the video impacted their perception of 1) the dangers of a lahar and 2) how they would respond to a scenario from Crater Lake: Your friend suggests that you should continue driving down towards Klamath Falls on Route 62 after hearing at Crater Lake Lodge warnings for a potential eruption. They claim that even if the volcano did erupt you would all make it out of the lahar hazard zones in time. Do you agree?

The usability test scenario can be found in Appendix A and Appendix B, including a comparison of Group 1 and Group 2 task and question order.

Image 1. Newberry Volcano, OR simplified hazards map
This usability study was conducted using Loop11, a remote UX software. First, the participants received a URL that took them to the unmoderated usability test (they completed the study on their own without guidance from a usability researcher). Then, participants went through a series of questions and tasks for these maps at their own pace. These questions and tasks for
the study were designed to evaluate the hazard maps’ utility and risk-communication. The study examined how the hazard maps communicate risk and how the users use and understand the volcanic hazards within each map.

TOP FINDINGS

The lahar video helped users better understand the severity of the volcanic hazard.
We asked the users if the video changed their impression of the lahar hazard represented in the maps. One user stated, “Yes. In the prior maps, the lahars seemed smaller and maybe easier to avoid. [The video] makes them very clear. And after watching the video, I fully understand the danger.”

Some colors were confusing for users.
Users did not express difficulty with the lahar hazard colors, but colors such as beige for regional lava flows and light pink/blush for near volcano or vent areas implied safety and they did not think it adequately showed the danger of these areas. Additionally, brown roads were hard to see in the map color scheme.

Users felt some map elements were not clearly represented in either the map legend or in the main map.
Many suggested the maps portrayed elements that were not adequately described in the legend, such as outline of national park, roads, hazard zone, and evacuation routes. As a result, the users were not sure of the importance of some elements, and therefore, did not find them useful.

The definition for the lahar hazard was confusing for users, and many felt it was an inadequate description.
75% of the participants from Group 2 selected “Poorly” for how well the Newberry Hazard Map adequately described a lahar - the video was shown before this question. In comparison, 50% of the participants from Group 1 choose “Well” for the map’s depiction of the lahar hazard -the video was not shown before this question.

This report includes the details of how we conducted our research, the results found, and a list of recommended changes for the maps used in the study.
**Outreach & Screening**

For the study, our participants were college students actively attending the University of Tennessee with one student attending Austin Peay State University (in Tennessee). Eleven students accepted the invitation and completed the study in its entirety. Six students completed the Group 1 study and five students completed Group 2 study. This number of users who participated met the range of participants one would want for a usability study.

**Participant Profiles**

Of our eleven participants, most considered themselves either “Not familiar” or “Slightly familiar” with volcano hazard maps and their ages mostly fell between eighteen and thirty-two with just one above that range. Only one participant considered themselves “Moderately familiar” with volcano hazard maps. In terms of general maps exposure, our participants interacted with maps on various frequencies, as shown in Tables 1. The backgrounds of our participants mainly consisted of those involved in Information Sciences with a few in fields such as Mathematics and International Business. The study duration ranged from 10 minutes to nearly 27 minutes.

Testing Setup & Post-Test Questions

In partnership with the USGS Cascades Volcano Observatory, the User-experience Lab at the University of Tennessee conducted a remote usability study from March 23rd to April 17th, 2021. This study was unmoderated and conducted virtually using Loop11, a tool for remote usability tests. Loop11 uses an interface that leads the participants through the tasks and questions within a pop-up window that was displayed over the hazard maps and video (Image 4).

Our study consisted of three volcano hazard maps. Group 1 viewed two maps (Newberry and Lassen) before they viewed a video of a lahar, and one map (Crater Lake) after they viewed the video. Group 2 viewed the Crater Lake map before viewing the video, and then viewed all three maps. We constructed the study to examine the effect a video showing a lahar hazard would have on the users' thoughts on the hazard maps' description of this hazard and how they would use the map for the real-world scenario within the study.

Participants were asked to complete nine tasks, including viewing the hazard map, identifying high and low hazard risk on the map, locating valleys near the volcano, and clicking on useful elements of the map and points of interest. After each task, the user answered post-task questions; there were a total of 24 that asked about what the user liked, disliked, and what they would want to see on the hazard map to help provide more utility for them.

The complete usability study can be found in Appendix A, and a comparison of the task and question order for Group 1 and Group 2 can be found in Appendix B.
RESULTS

The sessions were recorded for each participant and these recordings were reviewed and the data was analyzed. This data included time on task, task success rate, user satisfaction, and visible mouse movements. Below is a description of the findings found for each task and questions associated with each of the maps.

**Newberry Volcano**

Newberry Volcano hazard map was the first map Group 1 saw and the second map Group 2 viewed. Both groups are discussed below.

The first task on the Newberry volcano hazard map asked, “You will be shown a hazard map for 30 seconds. Take that time to review it. Go at your natural pace and where your attention is drawn. After 30 seconds, we’ll ask about your first impressions.” We then asked participants, “What information do you think this map is trying to convey?” All but one participant thought the map was trying to convey the hazard/danger areas if a volcano were to erupt. Their responses are below:

- The potentially dangerous zones which would exist if a volcano erupted
- Various areas with different types and extensions of lava flow
- Places that are dangerous in the case of a volcano, and the level of impact for an area.
- The areas/towns that would be affected if a volcano erupted.
- Where the danger zones are if a volcano erupts.
- Showing where the lava is from a volcano that erupts and then where the possible areas that could be severely/mildly affected
- hazard zones and dangerous areas surrounding a volcano in case of eruption
- The volcanic hazard zones in this area
- Where dangerous areas are in case of a volcanic eruption
- The risk areas for volcano eruption in this area, both near to the volcano and far-reaching (from lahars).
- It’s trying to be a volcanic hazard zone map.

The next task asked the user to click on the area where their attention was first drawn. This task was chosen to emulate eye-tracking and to see what visual elements gained the user’s attention. Their attention was drawn to the near-volcano area. All participants in Group 1 and 3 participants from Group 2 clicked within the Shield volcano hazard zone. One participant from Group 2 clicked on Three Sister Hazard Zone and one clicked on the city of Bend.

Next, Group 1 was asked to select one of three choices for what best described a lahar. Five of the 6 participants correctly said “A far-traveling volcanic mudflow or debris flow that moves violently along a valley,” and only one said “A collection of stationary volcanic debris found within a valley.”

Both groups were asked how well they thought the map described a lahar. Group 2 had a negative opinion, and three of the five participants thought the map “poorly” described a lahar (the other participant said “moderately well”). However, Group 1 had a more positive view of the lahar description. All Group 1 participants thought the map described lahar well to very well, including 33% who considered the description to be “very well”.

Group 2 viewed Crater Lake volcano and saw the lahar video before being shown the Newberry volcano, whereas Group 1 only viewed this map. Because Group 2 had more exposure and knowledge of lahar, it may have impacted their perception of its definition.

Both groups were given some open-ended questions to provide feedback on the map. We then asked them several questions about the colors used in the hazard map and any suggestions for improving the map. Their full responses can be found in Appendix C.

Participants pointed out that not all the map features are identified in the map legend, and they expected to find the information there. For instance, the peach color for the Shield Volcano Hazard Zone is not described in the legend (as is the purple area for Three Sisters Hazard Zone). One said, “I couldn't find what the dark peach color meant (outside of the near volcano color). I noticed after looking at it further that it says "Shield Volcano Hazard Zone" on the map, but I was looking for this information in the legend,” and another participant reiterated, “I'm not sure based on the legend what the gray shading in the Three Sisters Hazard Zone means, so maybe a more comprehensive legend would be helpful.”

Similarly, participants were not sure why ash was described in the legend but not represented in the map. One said, “I would also like to know why the volcanic ash is not shown (or why it is included in the legend if not shown).”
One participant thought the beige color for the regional lava flow zone seemed like a “safe” color, and more cautionary colors might be more useful. Another participant thought the red dot color that identified the towns was too similar to the hazard zone colors. They said, “The color of the lahars seems similar to the color of the dots that are next to town names (i.e. La Pine, Sunriver, etc.). I’m not sure if that is intentional or not, but it is a bit confusing.”

The last feedback some users had was on the lack of context for the Newberry Volcano (e.g. where is it in the US?). This might have been a disadvantage of how we portrayed it during the usability study, but it is important to keep in mind that providing additional regional information (e.g., state, location within a state, etc.) could help people understand where the volcano is located.

**Lassen Volcanic Center**

Group 1 was shown the Lassen Volcanic Center map second, while Group 2 saw this map last. On this map we focused on asking them to identify map elements (e.g., high or low risk and valleys).

![Image 7. Lassen Volcanic Center, CA simplified hazards map.](image)

We first asked participants to click on an area that has a high risk of experiencing a lahar if the volcano erupted. All participants in Group 2 correctly identified a dark red area of the lahar as an area at high risk (image 8), while four of the participants also correctly identified a deep red of the lahar hazard, two participants clicked on the “vent areas of explosive volcanoes.” Overall participants did not seem to have any issues identifying areas at high risk of lahar.
Next we asked them to click on an area they considered at low risk of experiencing a lahar if the volcano erupted (image 10 and 11).

However, the next task asked users to “click on an area on the map where a valley or river valley near the volcano resides.” Their responses indicate that they had a difficult time identifying valleys (images 12 and 13). First, participants took nearly twice as long to identify valleys as they did to identify high or low risk areas. On average, participants identified a high risk or low risk area in 20 seconds, while they took an average of 38 seconds to identify a valley.
Secondly, some participants struggled to identify a river valley that also was affected by lahar hazard. Group 2 was more successful than Group 1. Four of the 5 participants in Group 2 identified a river valley (primarily Battle and Bailey Creek), but Group 1, only half the participants identified a river valley that also was affected by lahar hazard. The other three participants selected a river near the volcano that was not affected by lahar. In a previous response about the Newberry Volcano map, one participant said, “It is also a little hard to see the topography beneath the colored sections,” and this might still be true for this map. This might have affected their ability to easily identify river valleys on the Lassen Volcanic Center map.

While participants seemed to struggle to identify valleys, nine of the 11 participants identified that high ground was safer from a lahar hazard. One participant said neither high ground nor river valley was safer and one thought the river valley was safer from lahar hazard (both in group 1).

Group 2 was asked, “How useful is the information provided in this hazard map?” Three of the five participants said it was useful, 1 participant said moderately useful and one said only slightly useful.

We wrapped up the section on the Lassen Volcanic Center map by asking for feedback on the map colors, elements, and additional comments. Participants had less to say about this map. This might be because many of their comments about Newberry volcano (and Crater Lake for Group 2) also applied to this map or participants might have become more familiar and comfortable with volcano hazard maps by this map. Their full responses can be found in Appendix C.

Some of their comments included:
• My only thought is that the roads are not included in the legend - I was able to figure out what the brown lines were through seeing them with the highway numbers, but there may be some confusion there.

• If the green outline for the National Park section is significant, I think it should be mentioned in the key. If not, it should be outlined in a more muted color.

• I'm confused by the regional lava flow description. What are surrounding volcanoes if they're not "next to" each other? I think the captions are a bit too complicated.

• The area adjacent to explosive volcanoes circle which doesn't communicate risk well. I also find myself ignoring the "regional lava flows." I understand this one better than the "area adjacent" element, but it doesn't convey risk with the same immediacy as the bold colors used for lahars and vent areas.

• Overall, clearly conveyed. As previously mentioned, I'm not sure how to interpret the "area adjacent to explosive volcanoes" which encircles an area that contains high and low risk places based on other information from the map. I'm also not entirely sure how to "use" this map, for example, for evacuation. All of the roadways seem to carry some risk and I'm not sure which one I should choose in an emergency situation based on the map.

Lahar Hazard Video

Group 1 viewed the lahar video about ⅔ of the way through the usability test--after answering questions about Newberry Volcano map and Lassen Volcanic Center map and before answering questions on Crater Lake map. Group 2 viewed the lahar video about ⅓ of the way through the usability test--after completing several on the Crater Lake map but before answering any questions on Newberry Volcano or Lassen Volcanic Center. We wanted to assess how viewing the video might impact their understanding of the hazard maps, and how it might impact how they would respond to a scenario using the Crater Lake map.

For both groups, we provided the USGS definition of a lahar: A lahar is a hot or cold mixture of water and rock fragments that flow quickly down the slopes of a volcano. They move up to 40 miles per hour through valleys and stream channels, extending more than 50 miles from the volcano. Lahars can be extremely destructive and are more deadly than lava flows.

Then they viewed the video of a lahar hazard from an eruption that occurred in Japan. The video was on its own web page for this study, but the same video was posted on YouTube: https://www.youtube.com/watch?v=kznwnpNTB6k. It is titled “Lahars in Japan” and was posted on Jan 29, 2012 by Apolline Project.

After viewing the one minute and 24 second video, the participants were asked, “What is your main takeaway from this video?” Their responses showed that the video portrayed how dangerous and fast lahars could travel. Their responses are listed below:

Group 1:
● Lahars are very fast-moving currents of hot (or cold) rock which are a very dangerous aspect of a volcanic eruption
● Lahars are extremely powerful and destructive. They also move very quickly through valleys or stream beds. Frightening videos!
● Nature is scary. That was a really alarming video.
● Lahars can be extremely destructive and dangerous to the people and land surrounding a volcano.
● Lahars are extremely dangerous and fast paced
● It comes very fast and takes out everything in its path. It happens in lower areas as well

Group 2:

● [one participant did not watch the video]
● Lahars are fast, turbulent, and potentially powerful.
● No response
● Lahars are very fast moving, comparable to fast moving water
● Lava flow looks very unnatural and moves very fast. I thought it would have had more viscosity.

**Crater Lake**

Crater Lake was the last map shown to Group 1 and the first map shown to Group 2 (image 14). For both groups we first showed the map for 30 seconds and asked to “Take the time to review it. Go at your natural pace and where your attention is drawn.” We then asked them to identify what part of the map first drew your attention, and 8 of the 11 participants identified Crater Lake, two participants identified Desert Creek lahar area, and one participant identified the Volcanic Hazard Zone legend.
Group 2 was then asked to select one of three choices for what best described a lahar. All but one correctly identified a lahar as a “Far-traveling mudflow.” This aligns with Group 1 response to this question about Newberry Volcano. The maps provide enough information for users to understand the basics of a lahar; however, as you’ll see by reading participant responses and in the discussion in this report, participants still tended to talk about lava when talking about lahars (e.g., “Lava flow looks very unnatural and moves very fast. I thought it would have had more viscosity.”). This is most likely because they have such a strong association with lava and volcanoes and can’t disassociate the two.

Each group was given a scenario: “Your friend suggests that you should continue driving down towards Klamath Falls on Route 62 after hearing at Crater Lake Lodge warnings for a potential eruption. They claim that even if the volcano did erupt you would all make it out of the lahar hazard zones in time. Based on this map - Do you agree? Please explain.” Group 1 watched the video of the lahar before answering the scenario while Group 2 answered the scenario before viewing the video of the lahar.

While both groups disagreed with their friend, Group 1 (who viewed the video) had more adamant responses:

- I don’t believe it’d be a good idea to do this, as the map clearly indicates that there are likely to be lahar zones running right around route 62 in that direction
- Nope, nope, nope. The road to Klamath Falls travels right along the Annie Creek creek bed.
- Wow. hard to say. I guess so? Or maybe not. the lahars move so quickly. I can’t see a better route though (actually, 62 to medford looks ok?)
• No, I do not agree. The video showed how fast and dangerous the lahar can be. A large overflow could come unexpectedly and we would have little time to make it out.
• No. We should not travel on 62, we would get caught in a lahar. I’m not sure what route we should take, but I know for sure we should not take route 62 towards Klamath Falls from Crater Lake Lodge. The lahar would be too fast and we would get caught in it.
• I would choose another route that is not near a river

The tone of Group 2 (who had not viewed the video) was not as strong:
• No, because the lahar zone follows Route 62 towards Klamath Falls all the way to the bottom of the map
• I do not agree; lahars seem to intersect with Route 62 at multiple points, sometimes for several kilometers.
• I would disagree because you are driving straight into where the lahar are.
• No, because Route 62 is on a high-risk lahar path. It is not worth risking whether we could make it out of a high risk area in time.
• I would agree but I don't know how fast lava flows.

We also asked Group 2 if there was anything missing on the map that they would need to help with the scenario. They responded that they needed more timing information on the map to help with the scenario, and it was hard to gauge the scenario because they didn’t know how quickly lahars moved. Their responses are below:
• If the map went down further so I could see where the lahar zone along Route 62 towards Klamath Falls ended, that would be helpful
• There is no temporal information that would determine how fast the lahars could reach a given area after eruption (and therefore whether I could arrive "in time").
• Time after eruption it would take for lava to read that point
• The scenario refers to making it away from the area "in time" but the map does not give any indication about how quickly a lahar would reach a certain area following an eruption.
• How fast does lava flow? I could gauge my timing better with this information.

The video helped Group 1 have a better sense of the timing, while Group 2 did not have that understanding to help with their scenario response. Group 2 was then shown the lahar video and USGS definition of a lahar before answering additional questions.

We wanted to evaluate how the video influenced their understanding and interpretation of the volcano hazard map. We first asked them directly, “Did the previously shown video change your impression of the lahar hazard represented on these maps?” All the participants said the video impacted their understanding by showing exactly how impactful/dangerous they are and also helped them realize how it could impact people in the hazard zones. Their responses are below:

Group 1
The previous video helped to put into perspective how dangerous these lahars are, and why they are important to pay attention to in a graphic about volcano hazards.

Yes, it gave me more context and explained why/how these areas could be so far reaching down riverbeds.

OH yes. In the prior maps, the lahars seemed smaller and maybe easier to avoid? This makes them very clear. and after watching the video? I fully understand the danger.

Yes, it did. Because the lahar is represented with orange and yellow, I thought that it consisted of lava even though the description said otherwise. After watching the video, I now realize its contents. I also understand how dangerous it is to the surrounding area.

After watching the video, I looked more closely at the lahars on the map and thought about all the people that could be impacted along the routes of those lahars.

It shows they are in or by mostly rivers.

Group 2

I had not imagined lahars being as fast or torrential.

No.

The video helps communicate the speed of the hazard, but did not change my impression of the overall risk. However, speed is an important aspect in planning a response!

Yes. I would not take any chances traveling down stream where the lahar can go. I'd rather stay on high ground, like on Mount Scott.

We then asked Group 1 and 2 if the video influenced how accurate they thought the map portrayed the dangers of lahars. While the video seemed to influence their understanding of lahars (see previous comments), they all thought the map accurately showed lahar hazards (figure 1).

We then asked Group 1 if they considered the information contained on the map to be useful (Figure 2). They all considered it useful. This aligns with Group 2, who was asked this question about the Lassen Volcanic Center map, who also considered that map to be useful.
Looking back at their earlier response to “what information Newberry Volcano is trying to convey?,” and 10 of the 11 participants said the map was trying to convey what areas/towns are in danger if a volcano erupted, it seems the map is successful at identifying hazards and hazard areas.

We ended the Crater Lake section by asking them for any feedback on colors, map elements, and additional suggestions. Most of their feedback for the Crater Lake map reflected their earlier feedback for the previous two maps. Their full responses can be found in Appendix B.

Participants were also unsure what the gradient levels besides the lahar meant, as one said. “It is unclear to me whether the color gradient for the lahars corresponds to danger; i.e., are the red areas at higher risk than the yellow areas, and if so, how is this measured? I cannot find this addressed in the keys. Also, it appears that the entire map is within a lava flow zone of some point (near-volcano, lahars, or regional lava zone), with no "safe areas", but this is a little confusing — maybe it would also be helpful to mention this somewhere on the key, even if it is not shown, as you did with volcanic ash.” Overall, additional information in the map legend would greatly improve the usability of the volcano hazard maps.
USABILITY FINDINGS & RECOMMENDATIONS

ISSUE SEVERITY RATING KEY

The symbols below are used to rate each usability issue or finding in terms of its importance or impact to the usability of the simplified hazard map. Ratings are based on the number of users who had the problem and also how seriously the problem affected the user or kept the user from completing the task. Usability issues are also determined by how they measure to the usability guidelines recommended by usability.gov\(^1\) and Nielsen Norman Group’s 10 usability heuristics for user interface design.\(^2\)

Each UX issue documented in this section was assigned a priority level based on the following criteria:

**Low:** User may experience insignificant time delays or mild frustration, but will be able to complete the task.

**Medium:** User may experience noticeable delay or frustration, but will be able to complete the task with added effort.

**High:** User will experience noticeable delay or frustration, may not be able to complete the task.

**Success:** Users were able to easily perform their desired task

**Data:** Describes summarized data of interest

---

\(^1\) [https://guidelines.usability.gov/](https://guidelines.usability.gov/)

\(^2\) [https://www.nngroup.com/articles/ten-usability-heuristics/](https://www.nngroup.com/articles/ten-usability-heuristics/)
1. Intentional Use of Colors

There were several usability issues about the use of color in the map. The use of colors could incorrectly link map elements or cause inaccurate interpretations. These issues include:

- The dots that represent cities/towns are orange-red, which is the same color that is used to indicate lahars.
- Beige is typically a neutral color and users could overlook that it indicates a hazard and is not a “safe” or background color. Especially maps where the entire map is beige, it could be easy to overlook that beige has a hazard meaning.
- Brown road lines blend into the other hazard zone colors.

Recommendations:
- Use colors intentionally
- Remember color has an implied meaning.
  - Red often represents hazard/danger, but colors like beige are often viewed as neutral or safe, this could result in users misinterpreting parts of the maps.
- Brown may not be the best color to represent roads. Consider alternative colors (e.g., black) that will stand out against the background.

2. Representation on Map and Map Legend

There were several usability issues with the map and map legend. Some items on the map were not displayed in the legend. This created confusion about what the map elements or colors meant. This included:

- Shield volcano hazard zone (Newberry)
- Three Sisters hazard zone (Newberry)
- Roads/evacuation routes (all maps)
- White triangle (Peak)
- National Park lines (Lassen Volcanic Center and Crater Lake)

Recommendations:
- All elements that are presented on the map should be identified in the legend. Currently the legend only displays volcano hazard zones, but there are other elements that need clarification.
  - Shield Volcano hazard zone on the Newberry map should be identified in the legend.
  - Road color/symbol should be identified in the legend.
  - The volcano or mountain peak (white triangle symbol) should be identified in the legend. It could be easy to overlook, especially on maps like Crater Lake where the peak is not in the near-volcano hazard zone.
- Specifically, for the Three Sisters Hazard zone, it is not clear that the Newberry volcano is so close to another volcano (Three Sisters) that its hazard zones are appearing on the
Newberry volcano map. This relationship and how each volcano appear on the other hazard map should be marked clearly in the legend.

3. Representation on Ash

Ash is presented in the legend but not displayed on the map. Users struggled to understand why it could not be displayed on the map. Identifying that volcanic ash is “not shown” in the map is not a strong enough indicator to identify 1) how ash could affect the map areas 2) why ash is not shown.

Recommendation:
- Add text to the legend that explains that ash could affect all shown areas of the map or similar wording to indicate how ash is part of the hazard map. Currently, the legend only gives a description, which is not useful when identifying volcano hazards.

4. Uniformity Among Maps

Some maps (e.g. Newberry and Crater Lake) use the salmon/pink color to represent near-volcano hazards, while other maps (e.g. Lassen Volcanic Center) use the salmon/pink color to represent vent areas of explosive. If a user is viewing multiple maps, they may not closely read each map legend, and instead, infer information portrayed on one map based on previous map legend.

Recommendation:
- Each volcano hazard map should be uniform. Each should use the same color/symbol to mean the same thing. If maps have different elements, then a new color/symbol should be used.
  - Or if the color/symbol indicates the same thing, the wording should also be the same. If near-volcano hazard zone and vent areas of explosive volcanoes are the same thing they should use the same wording.

4. Lahar Hazard Levels

The simplified hazard maps provide a gradient scale next to lahars in the volcano hazard zone legend, but there is no definition of the colors’ meaning. Users are left to interpret the gradient scale on their own and make their own assumptions about risk.
Recommendation:
As with usability issue #2, the map legend needs to provide more information to help users correctly identify volcano hazards and their risk level.

5. Novice Users Understanding of Lahar

While the simplified volcano hazard maps identify lahar hazards with an understandable definition and with clear colors that indicate hazard, users unfamiliar with the region or volcano hazards might still miss the importance signified by the hazard maps. The video showing the lahar in Japan seemed to greatly impact how the participants viewed the information on the map. Many indicated that they did not realize how dangerous and fast-moving lahars were or how hard a lahar would be to escape before viewing the video.

Recommendation:
● It might be useful to always provide information or links to information near the simplified hazard maps to provide additional context.
● As you design hazard maps, keep in mind that many users are unfamiliar with the content and terminology that may be common for the map-creator (e.g., lahar, pyroclastic flow, tephra, ballistic ejecta, etc.).
Overall, the simplified volcano hazard maps accurately portrayed the volcano hazards present in the area. Making simple changes like adding additional elements to the legend and changing the color of roads and towns could help improve the usability of the maps. Additionally, keeping things consistent between maps, including colors and terminology, will improve their usability. It is also important to keep in mind that many users of these hazard maps will not be familiar with volcano hazards and using clear and simple language and providing additional context (e.g., more description, additional links, identifying the small map on a larger map) could help even the most novice correctly interpret the map elements and its purpose.
APPENDIX A: STUDY TASKS AND QUESTIONS

- **Question 1 - Measuring Hazard Map Proficiency [Rating Scale]**
  - How familiar are you with hazard maps for volcanoes?

- **Question 2 - Measuring General Map Exposure [Rating Scale]**
  - How often do you interact with maps in general?

- **Question 3 - User’s Background [Open Ended: 1 Item]**
  - What is your discipline/field of study?

- **Question 4 - User’s Age [Rating Scale]**
  - What is your age?

- **Task 1 - First Impression - Newberry Volcano [Time Bound]**
  - You will be shown a hazard map for 30 seconds. Take that time to review it. Go at your natural pace and where your attention is drawn. After 30 seconds, we’ll ask about your first impressions.

- **Question 5 - User’s Understanding [Open Ended: Comment Box]**
  - What information do you think this map is trying to convey?

- **Task 2 - User’s First Observation [First Click]**
  - Click on a part of the map that first drew your attention.

- **Question 6 - User’s Recollection [Multiple Choice: 1 answer]**
  - Which one of these statements below best describes a lahar?
    - A flow of lava found near a volcano. (1)
    - A collection of stationary volcanic debris found within a valley. (2)
- A far-traveling volcanic mudflow or debris flow that moves violently along a valley. (3)

- **Question 7 - Colors on Map - Newberry**
  - How do you feel about the use of colors in this hazard map?

- **Question 8 - Discussing Perplexity -Newberry**
  - Is there anything confusing about this hazard map? If so, please explain.

- **Question 9 - Comments/Suggestions - Newberry**
  - Are there any other comments or suggestions for how we could improve this map?

- **Question 10 - Effectiveness of the Map’s Lahar Description [Rating Scale: 1 answer]**
  - How well does this hazard map adequately describe a lahar?

- **Task 3 - High Risk Lahar Hazard - Lassen Volcanic Center [First Click]**
  - You will be shown another hazard map. When shown, click on the area that has a high risk of experiencing a lahar if the volcano erupted.

- **Task 4 - Low Risk Lahar Hazard - Lassen Volcanic Center [First Click]**
  - You will be shown another hazard map. When shown, click on the area that has a low risk of experiencing a lahar if the volcano erupted.

- **Task 5 - Valley/River Valley Near Volcano - Lassen Volcanic Center [First Click]**
  - Click on an area on the map where a valley or river valley near the volcano resides.

- **Question 11 - Lahar Safety - Lassen Volcanic Center [Multiple Choice: 1 answer]**
  - Which of the two options is safer from a lahar hazard?
    - High ground
• River valley

• Neither

• Task 6 - Click on Useful - Lassen [First Click]
  ○ Click on an area on the map that informed your decision for the previous question.

• Question 12 - Colors and Symbols on Map - Lassen [Open Ended: Comments box]
  ○ Are there any particular elements (colors and symbols) on this map that make it difficult to understand? If so, which ones?

• Question 13 - Discussing Perplexity - Lassen [Open Ended: Comments box]
  ○ Is there anything confusing about this hazard map? If so, please explain.

• Question 14 - Comments/Suggestions - Lassen [Open Ended: Comments box]
  ○ Are there any other comments or suggestions for how we could improve this map?

• Task 7 - Lahar Video [Time Bound]
  ○ The USGS provides the following definition of lahars.

  ■ Definition:

  ● A lahar is a hot or cold mixture of water and rock fragments that flow quickly down the slopes of a volcano. They move up to 40 miles per hour through valleys and stream channels, extending more than 50 miles from the volcano.

  ● Lahars can be extremely destructive and are more deadly than lava flows.

  ○ You will be shown a short video of a lahar hazard from an eruption that occurred in Japan. After reviewing the video, we will then ask about your impressions.

• Question 15 - User’s Takeaway [Open Ended: Comments box]
○ What is your main takeaway from this video?

- **Task 8 - Second Impression - Crater Lake [Time Bound]**
  ○ You will be shown another hazard map for 30 seconds. Take the time to review it. Go at your natural pace and where your attention is drawn. After 30 seconds, we’ll ask about your thoughts on it in relation to the video you just watched.

- **Task 9 - User’s First Observation - Crater Lake [First Click]**
  ○ Click on the part of the map that first drew your attention.

- **Question 16 - User’s Opinion of Map After Video [Open Ended: Comments box]**
  ○ Did the previously shown video change your impression of the lahar hazard represented on these maps? Please explain.

- **Question 17 - Hazard Map Accuracy - Crater Lake [Rating Scale: 1 answer]**
  ○ Based on the previous video, how accurate do you feel the map shows the dangers that lahars pose?

- **Question 18 - Scenario - Crater Lake [Open Ended: Comments box]**
  ○ Your friend suggests that you should continue driving down towards Klamath Falls on Route 62 after hearing at Crater Lake Lodge warnings for a potential eruption. They claim that even if the volcano did erupt you all would make it out of the lahar hazard zones in time.
    - Based on this map and the video you previously watched - Do you agree? Please explain.

- **Question 19 - User’s Thoughts on Map - Crater Lake [Open Ended: Comments box]**
  ○ Is there other content or information that's missing on this hazard map that would have been helpful for this scenario?

- **Question 20 - Measuring Usefulness - Crater Lake [Rating Scale: 1 answer]**
○ How useful is the information provided in this hazard map?

• Question 21 - Colors on Map - Crater Lake [Open Ended: Comments box]
  ○ How do you feel about the use of colors in this hazard map?

• Question 22 - User Thoughts on Clarity - Crater Lake [Open-ended: Comments Box]
  ○ Is the information conveyed clearly? If not, what do you feel is missing?

• Question 23 - Discussing Perplexity - Crater Lake [Open-ended: Comments Box]
  ○ Is there anything confusing about this hazard map? If so, please explain.

• Question 24 - Comments/Suggestions - Crater Lake [Open-ended: Comments Box]
  ○ Are there any other comments or suggestions for how we could improve this map?

• Question 25 - Study Feedback [Rating Scale: 1 answer]
  ○ How was your experience with the task and questions within this research study?

APPENDIX C. PARTICIPANT RESPONSES

Comments on Newberry Volcano

Group 1 (3 open-ended questions)

● How do you feel about the use of colors in this hazard map?
  ○ I think that they are well-chosen to convey the meanings they are trying to
  ○ I liked them, and found them useful. However, I couldn't find what the dark
    peach color meant (outside of the near volcano color). I noticed after looking at
    it further that it says "Shield Volcano Hazard Zone" on the map, but I was looking
    for this information in the legend.
  ○ the colors are fine. not to alarming.
  ○ I think the use of colors was effective in this map. They were not overly vivid,
    but my eyes were still drawn to the areas that would be most effected. It may be
    better to use a different color for the regional lava flows zone because beige
    seems like a "safe" color. These areas are still affected so a more cautionary
    color may be more useful.
  ○ The color of the lahars seems similar to the color of the dots that are next to
    town names (i.e. La Pine, Sunriver, etc). I'm not sure if that is intentional or not,
    but it is a bit confusing. I'm not sure what the lighter color surrounding Newberry
    Volcano is supposed to indicate. Because the legend makes it seem like the
    smaller circle that encompasses Paulina Lake matches the "Near Volcano" part of
    the legend.
  ○ They are quite similar but they match the colors of lava. They are not too similar
    to differentiate. The ash should have been shown in some way too.

● Is there anything confusing about this hazard map? If so, please explain.
  ○ No, I don't believe there is anything confusing about the map
  ○ Please see the last comment. I would also like to know why the volcanic ash is
    not shown (or why it is included in the legend if not shown).
  ○ Not really
  ○ i did not find anything confusing about this map
  ○ Besides the colors, I think everything else looks clear.
  ○ This map doesn't show where is it well. I know none of these places so I am at a
    disadvantage. Again, why talk about volcanic ash if its not shown

● Are there any other comments or suggestions for how we could improve this map?
  ○ I can't think of any improvements to be made to this map!
  ○ See previous two comments. It is also a little hard to see the topography beneath
    the colored sections.
  ○ I can't think of any improvements to be made to this map!
  ○ I think the Volcanic Ash zone should also have some sort of visual on the map
    since it is mentioned in the key.
  ○ There are two different "Hazard Zones" - Three Sisters and Shield Volcano. I think
    it would be helpful to distinguish what those mean from what is on the legend.
Show the regions of volcanic ash and make sure viewers know what area they are looking at. I don't personally know where any of these markers are, so I do not know where this volcano is.

Group 2 (Open-ended suggestions)

- I’m not sure based on the legend what the gray shading in the Three Sisters Hazard Zone means, so maybe a more comprehensive legend would be helpful.
- The blue in the Three Sisters Hazard Zone doesn’t appear to match anything in the key; is this a body of water, and if so, why isn’t it just stark blue like the other lakes and rivers?
- No comments
- I did not immediately realize that the orange-shaded "Shield Volcano Hazard Zone" area was labeled on the map and was looking for that color in the key.
- Elevation lines. I feel this map didn’t have enough information somehow.

Comments on Lassen Volcanic Center

Group 1

- How do you feel about the use of colors in this hazard map?
  - No, I believe the map portrays its information well
  - My only thought is that the roads are not included in the legend - I was able to figure out what the brown lines were through seeing them with the highway numbers, but there may be some confusion there.
  - No
  - I wasn’t quite sure why the National Park was outlined so clearly.
  - no
  - No
- Is there anything confusing about this hazard map? If so, please explain.
  - No, I think I understand everything that was meant to be conveyed
  - No I dont think so
  - No
  - I find the symbol used for the "Area adjacent to explosive volcanoes" to be a little confusing. I would have preferred just a normal outlined circle
  - No
  - No
- Are there any other comments or suggestions for how we could improve this map?
  - I don't believe so
  - Nothing else for me
  - could be clearer on where exactly to go?
  - If the green outline for the National Park section is significant, I think it should be mentioned in the key. If not, it should be outlined in a more muted color.
  - No
  - Show the volcanic ash areas and give a location to where this volcano is.
Group 2

- Is there anything confusing about this hazard map? If so, please explain.
  - No
  - It looks OK to me. Maybe it would be helpful in some instances to see the borders of the municipalities.
  - No comments
  - I'm not clear what the risk level is for the "area adjacent to explosive volcanoes." It is confusing to me that parts of this encircled area are not shaded one of the colors with a specified type of risk.
  - I'm confused by the regional lava flow description. What are surrounding volcanoes if they're not "next to" each other? I think the captions are a bit too complicated.

- How do you feel about the use of colors in this hazard map?
  - No
  - Not really. As I mentioned on the first map, it would be nice to know whether or not the gradient for the lahars is indicative of anything or not.
  - No
  - The area adjacent to explosive volcanoes circle which doesn't communicate risk well. I also find myself ignoring the "regional lava flows." I understand this one better than the "area adjacent" element, but it doesn't convey risk with the same immediacy as the bold colors used for lahars and vent areas.
  - I like that this map showed topography

- Are there any other comments or suggestions for how we could improve this map?
  - No
  - It may be helpful to have a panel placing the map in a broader geographic context.
  - No
  - Nothing I haven't mentioned in other questions!
  - Good

- Is the information conveyed clearly? If not, what do you feel is missing?
  - Yes
  - The information is conveyed clearly. It may be helpful to know how "area adjacent to explosive volcanoes" is determined.
  - Yes
  - Overall, clearly conveyed. As previously mentioned, I'm not sure how to interpret the "area adjacent to explosive volcanoes" which encircles an area that contains high and low risk places based on other information from the map. I'm also not entirely sure how to "use" this map, for example, for evacuation. All of the roadways seem to carry some risk and I'm not sure which one I should choose in an emergency situation based on the map.
  - The circle for volcanic center.
Comments on Crater Lake
Group 1

• How do you feel about the use of colors in this hazard map?
  ○ Again, I think they are great representations of the hazards they are associated with.
  ○ I like that the lahars are colored in red and yellow gradient to indicate danger.
  ○ really good. clear
  ○ Like I stated earlier, the orange and yellow for the lahar shows that it is hazardous but also gives the first impression that it is made up of lava. Overall, the colors give a clear picture of where the real danger is.
  ○ The colors are clear
  ○ The near-volcano color should be changed to draw more attention to it.

• Is the information conveyed clearly? If not, what do you feel is missing?
  ○ I believe all information is conveyed clearly.
  ○ Again, I am left wondering about the volcanic ash. I would like to know the extent of this, how dangerous it is, etc. Actually, the danger level of each hazard would be helpful.
  ○ I mean, aside from a clear escape route, but I guess if you avoid the lahars you'd be ok.
  ○ I think the actual volcano should be highlighted more clearly. It took me a little while to find it since it was not in the center of the "near-volcano" section.
  ○ If there are safer routes to take to get away from the volcano, I'm not sure what they are from this map. I'm not familiar with the area, however.
  ○ Volcanic ash is not shown

• Is there anything confusing about this hazard map? If so, please explain.
  ○ No, nothing is confusing to me
  ○ I don't think so
  ○ Not at all confusing
  ○ I am confused as to why there is no near-volcano zone right around the volcano. I think it is confusing what the direct surrounding area to Mount Scott is truly like.
  ○ It is hard to tell where is safe on this map.
  ○ No

• Are there any other comments or suggestions for how we could improve this map?
  ○ If I had to pick something, I would only wonder if the roads could be made a little more obvious as to what they are. But I think that even that is nitpicky
  ○ None except those already stated
  ○ Just the clearly noted escape routes
  ○ I believe I shared all the suggestions I have
  ○ N/A
  ○ the ability to zoom out and see more of the area and make notes to people with this map of safety routes.
Group 2

- Is there anything confusing about this hazard map? If so, please explain.
  - No, I think the map seems pretty straightforward
  - It is unclear to me whether the color gradient for the lahars corresponds to danger; i.e., are the red areas at higher risk than the yellow areas, and if so, how is this measured? I can not find this addressed in the keys. Also, it appears that the entire map is within a lava flow zone of some point (near-volcano, lahars, or regional lava zone), with no "safe areas", but this is a little confusing — maybe it would also be helpful to mention this somewhere on the key, even if it is not shown, as you did with volcanic ash.
  - No
  - Overall, very clear. However, it's not clear to me what the best option for evacuation from the Rim Drive area would be because it appears that all directions with roadways have moderate to high risk for lahars. The map does a good job of communicating risk, but not of helping me to formulate a response to that risk.
  - If I had an elevation reference, it would help be better understand how the lahar may flow.
- Any additional comments?
  - No
  - I found the definition for lahars a little confusing at first.
  - No
  - My attention is immediately drawn to Crater Lake because of its size and the size of the font for its label. Not being familiar with the area, it is helpful to orient me geographically, but if I were more familiar with the area this might take away from the other details I am supposed to be focusing on.
  - Expand the volcanic hazard zone. Wherever lava can flow should be within the zone.
