The Municipal Technical Advisory Service (MTAS) was created in 1949 by the state legislature to enhance the quality of government in Tennessee municipalities. An agency of the University of Tennessee Institute for Public Service, MTAS works in cooperation with the Tennessee Municipal League and affiliated organizations to assist municipal officials.

By sharing information, responding to client requests, and anticipating the ever-changing municipal government environment, MTAS promotes better local government and helps cities develop and sustain effective management and leadership.

MTAS offers assistance in areas such as accounting and finance, administration and personnel, fire, public works,

law, ordinance codification, and water and wastewater management. MTAS houses a comprehensive library and publishes scores of documents annually.

MTAS provides one copy of our publications free of charge to each Tennessee municipality, county and department of state and federal government. There is a \$10 charge for additional copies of "How Any City Can Conduct a Utility Rate Study and Successfully Increase Rates."

Photocopying of this publication in small quantities for educational purposes is encouraged. For permission to copy and distribute large quantities, please contact the MTAS Knoxville office at (865) 974-0411.

# HOW ANY CITY CAN CONDUCT A UTILITY RATE STUDY AND SUCCESSFULLY INCREASE RATES

The mayor and board of alderman of Any City had just finished listening to a presentation from the water/sewer manager about needed projects. The water and sewer systems had challenges in two areas. The mains, especially sewer lines, in the heart of the city were old and badly needed repair. The manager kept talking about “I & I,” finally explaining that this meant inflow of surface water and infiltration of groundwater into the sewer system. In other words, the sewer lines and manholes were cracked allowing extraneous water to enter the system. Heavy rains resulted in excess water being transported through the sewer lines to the treatment plant. This caused an increase in operational expenses and often caused operational compliance problems.

The manager mentioned that the “man from the state” had been over to talk about the problems, and the city needed to take corrective action soon or potentially face fines and enforcement action.

He said that water lines, particularly the old downtown lines, were deteriorated and the “water loss” was excessive. He explained that water meters in the downtown area were old and most likely not registering all the water being used. Since the sewer bills were calculated using water consumption, the resulting loss of revenue was compounded. Any City was likely losing revenues in both water and sewer billings because of the old meters.

The second major challenge came from an area where the interstate highway intersected the city limits. Commercial and residential developers were clamoring for water and sewer service. While water service was available in this area of town, lines were sized inadequately for large demands. Sewer service was not available. If development of this

area was going to occur, water infrastructure had to be expanded, and sewer infrastructure had to be installed. Any City’s engineering firm had just finished a cost study for these improvements. To expand water service and sewer service to meet the demands of new development would cost more than \$6 million. Repairs, replacement, and rehab of existing lines would cost more than \$4 million. The good news was that Any City’s water and sewer treatment plants were capable of handling new growth, particularly if water loss and I/I were reduced.

The bottom line, the manager explained, was that several million dollars were needed to fund these projects. The city administrator said that some monies could eventually be recouped from new development. However, improvement of existing mains in the downtown area would not result in any new customer revenues. She concluded by saying that the city would probably qualify for some grant monies but nothing approaching the total needed. Silence filled the room as the water/sewer manager took his seat and the enormity of the challenge settled in.

Sound familiar? This meeting could have taken place in your city. Water and sewer operations and maintenance problems challenge city leaders everywhere. Add to this increasing federal and state regulations and it is easy to see why many municipal decision makers feel overwhelmed. The answer for Any City lies in bringing together a combination of factors, including proper planning and financial resources. The mayor and alderman instructed the city administrator to work with the water/sewer manager and finance director to come up with a funding plan.

Planning new projects, meeting the demands of customers, dealing with rising costs, and complying with new laws and regulations are all part of operating a municipal water/sewer system. And they all have one thing in common — money. As the city staff began to assess the task, they quickly realized that the current water/sewer revenues were simply inadequate. But how much would they need, how would rates be impacted, and how would rate payers react?

### **“We need a rate study.”**

As the city administrator, water/sewer manager, and finance director discussed their assignment, it became apparent that the focus could not be limited to capital projects but would need also to include all the operation and maintenance expenses, depreciation expense, and debt obligations. It had been several years since consultants from the University of Tennessee (UT) Municipal Technical Advisory Service (MTAS) had assisted with developing financial projections and suggested new rates for the water/sewer fund.

Should we call MTAS? Or, since we have a previous study as guideline, can we do it ourselves? Any City’s staff decided to undertake the task.

### **“Where do we begin?”**

The staff had completed step one of the water/sewer rate study — deciding who is going to do it. Cities have several options, including hiring an engineering firm, hiring other consultants, or doing it in house. Sometimes bringing in someone from the outside is the best option. A third party may have fresh perspectives and ideas and may lend credibility to the staff’s recommendations in the eyes of the governing body and customers. If the city has staff with the expertise and time to devote to the task, they may choose to conduct the study in house.

Next, city staff talked with the mayor to gain more specific information on his expectations for the study. With any utility rate study, it is important to establish what is to be accomplished. Goals may include:

- Generating additional revenues to keep up with inflation. The costs of operations may have risen due to inflation, and the city merely needs additional revenues to cover those costs.
- Obtaining new loans. The city may need to borrow money for capital improvements and, therefore, needs to generate additional revenue to cover debt service (i.e., principal and interest). This could include items such as the infrastructure improvements and replacement described above or updating treatment plants or pump stations. Or, it may include new infrastructure to meet growth requirements or be a combination of several things.
- Examining the rate structure. This involves an evaluation of rates by customer class to see if various customer classes are paying fairly. It may involve simplifying a complicated rate structure or, if the city wants to encourage water conservation, changing the rate structure to charge higher rates for large volume users may be a goal.

The mayor and staff of Any City outlined the following goals:

1. Generate additional revenues to fund needed infrastructure improvements and expansions. Funds would come from a combination of user fees, loans, and grants.
2. Make water and sewer rate structures fair for all users.
3. Comply with professional and regulatory requirements.
4. Examine and modify (if needed) water and sewer policies, including extension policies, connection and tap fees, etc., to ensure that “new” customers were not being allowed to connect onto the system at the expense of existing customers.

5. Develop rate and policy information that is easy to explain to rate payers.
6. Develop a communications plan to inform customers.

### “Let’s look at the calendar.”

The mayor and staff concluded by setting a date for completion of a draft study. They considered deferring the study until after the council election, which was still six months away. If the city leadership is likely to change soon, it may be a good idea to wait until the new officials are on board before making major rate decisions. Since the majority of the governing body of Any City was not likely to change, they decided to go ahead with the study.

The next task — a large one — consisted of pulling together information needed for the study. This work generally falls to the finance director. The study would encompass two areas: income projections and the related cash flow. They made a list of items needed:

#### 1. Financial records

- a. Audits for the previous 2 to 3 years;
- b. The previous year-end financial reports if the audit has not been completed);
- c. The current year-to-date financial report; and
- d. Principal and interest schedules for any new debt not already included in the financial reports.

#### 2. Billing records

A 12-month summary of water and sewer billings listed by customer totals, consumption totals, and total revenues for each separate rate classification.

#### 3. Capital projects

A list of planned capital improvements and their estimated costs for the next few years. The list should include the project cost and its estimated fiscal year(s) of completion, number of new customers, and usage projections.

#### 4. Water/sewer policies and operational guidance

- a. Water and sewer usage fees;
- b. Code of ordinances;
- c. Any uncodified water/sewer ordinances enacted since the last code update; and
- d. Operational guidance documents pertaining to extensions, tap fees, connection fees, and so forth.

### “We’ve gathered information. Where do we go from here?”

The city administrator, water/sewer manager, and finance director met in the conference room. The table was stacked with financial and billing records and policies. They had met with the city’s consulting engineer and determined estimated costs for capital improvements and a project implementation schedule for the next few years. They began with the premise that any good business would begin with a determination of costs before setting the price to charge. They also determined to keep the following principals in mind.

#### HOW THE OPERATION IS FUNDED

Governmental water and sewer operation should be established as an enterprise fund. In *Government Accounting, Auditing, and Financial Reporting* (Chicago: National Committee on Governmental Accounting Publications No. 18, 1968), “enterprise fund” is defined as:

...a fund established to account for operations (a) that are financed and operated in a manner similar to private business enterprises — where the intent of the governing body is that the costs (expenses, including depreciation) of providing goods and services to the general public on a continuing basis be financed or recovered primarily through user charges; or (b) where the governing body has decided that periodic determination of revenues

earned, expenses incurred, and/or net income is appropriate for capital maintenance, public policy, management control, accountability, or other purposes.

The definition of an enterprise fund implies that sufficient user fees should be established to ensure that the utility can operate on a self-sustaining basis. The major source of revenue for water and sewer funds is user fees.

### LEGAL ISSUES

T.C.A. § 68-221-1008 provides for state intervention into the financial affairs of financially distressed city-owned water and wastewater systems. The Water/Wastewater Financing Board was established to ensure that systems operate on a sound financial basis. Bond covenants and local legal requirements, such as inter-local contracts, must be considered as well.

### FAIRNESS

Costs for operations and maintenance (O&M) should be recovered from customer classes in proportion to the costs of providing service to those customers. The user fee should be fair to all customer classes. Discounted rates and subsidies may be viewed as discriminatory.

### IMPACT ON CUSTOMERS

Any City decided it would give customers information about any planned changes in advance

with explanations on why changes were needed. When modifying an existing user charge system to achieve greater fairness, sudden drastic changes can have negative consequences when costs are redistributed to certain user classifications. For this reason, a planned, phased-in approach to implement major changes gradually over a period of time is usually best.

### SIMPLICITY

The utility’s user charge system should be easy to understand and easy for officials to explain to the public. Generally, sewer rate structures that are similar to water rate structures are easy to understand.

### COMPETITIVENESS

The first thing a customer wants to know about water and sewer rates is how their rates compare with comparably sized cities or with cities in the same geographical proximity. This information is particularly important for commercial and industrial users.

### “Are we charging all our customers fairly?”

Fairness is an important consideration for setting water and sewer rates. No group of customers should be subsidizing another group unless there are good reasons. The 12-month billing summary for the water department is shown in Table 1.

**TABLE 1. ANY CITY — WATER BILLING SUMMARY BY CUSTOMER CLASS**

	NUMBER OF BILLS	CONSUMPTION (GALLONS/YEAR)	REVENUES/YEAR
Residential Inside	4,000	30,000,000	\$630,000
Residential Outside	1,000	6,000,000	\$163,000
Commercial Inside	100	20,000,000	\$428,109
Commercial Outside	12	4,000,000	\$150,000
Utility Districts	1	12,000,000	\$350,000
Industrial	7	7,200,000	\$176,870
<b>Total</b>	<b>5,120</b>	<b>79,200,000</b>	<b>\$1,897,979</b>

The finance director calculated percentages for each rate classification and made the comparisons shown in Table 2.

**TABLE 2. ANY CITY — WATER USAGE VERSUS REVENUE BY CUSTOMER CLASS**

	CONSUMPTION (GALLONS/YEAR)	%	ANNUAL REVENUES	%
Residential Inside	30,000,000	38%	\$630,000	33%
Residential Outside	6,000,000	8%	\$163,000	9%
Commercial Inside	20,000,000	25%	\$428,109	23%
Commercial Outside	4,000,000	5%	\$150,000	8%
Utility Districts	12,000,000	15%	\$350,000	18%
Industrial	7,200,000	9%	\$176,870	9%
<b>Total</b>	<b>79,200,000</b>	<b>100%</b>	<b>\$1,897,979</b>	<b>100%</b>

Since the % Consumption and % Revenue columns in Table 2 closely match within a few percentage points, staff decided that the current rate structure treats customer groups fairly. No structural changes would be needed to the current rates.

The fairness test was repeated for the sewer rate structure with similar results.

**Note:** Multiple step declining block rate structures are likely to lead to fairness issues. In such rate structures, large volume users are usually found to be paying less than their fair share. Many cities decide on lower water and sewer rates for large volume users, such as manufacturing facilities, because of the benefits they add to the city, such as jobs.

**“We have all the pieces in place, how do we bring it all together?”**

The first step involved building a spreadsheet that included a financial history of the city’s water and sewer funds for the previous two to three years (or longer), the current year, and projections for future years. The history provided a foundation for projections. The spreadsheet format should be similar to the income statements in the city’s audit. It should include revenues, operating and

maintenance expenses, depreciation, interest earnings and interest expense. Grants and monies received as contributed capital are now included on the income statement as non-operating revenue. Contributed capital includes items such as tap fees, payments from developers, and any other fees paid to directly offset the capital costs of the utility. Not included on this statement are principal payments on long-term debt and the amount of capital projects completed. Those two items will be included in the cash flow analysis.

Next, staff dealt with the current year. The finance director took the current month-end financial statements and projected them to year end. Some items were fixed and pretty easy to project (i.e., depreciation and debt interest). For the variable items, revenues and expenses, the director looked to the current year’s trends and the history of the last few years. Events such as weather-related usage and large customers being added or deleted have to be taken into account. The director reviewed expenses with the water/sewer manager by asking questions such as: Is there a large one-time expense that affects any of the trends? Are there areas we know will encounter a significant increase or decrease in revenues or expenses? For example, if you expect that the amount the city pays for employee health

insurance to increase 10 percent next year, that factor impacts projections. Or, perhaps a new area has been put into service and the city expects to see a greater than normal increase in revenues. The staff considered all of these factors to project the current year.

Next, they projected future revenues and expenses. They considered the history and looked at growth of revenues. They decided on a modest 1 percent growth rate for water sales and a 0.5 percent growth rate for sewer service sales. Realistically, expenses continue to rise. The staff would likely receive cost-of-living increases. Insurance costs would rise faster than inflation rates. After consideration, staff settled on a ~3 percent annual increase in operating and maintenance expenses.

### **“The dreaded D word: depreciation.”**

Often, one of the largest single expenses is depreciation. Since depreciation is the annual expensing of the utility’s assets over their useful life, staff looked to the depreciation schedule for assets on hand and to the capital projects costs projections. Using projected costs as a guide, staff developed a depreciation schedule for the addition of these new assets. They knew that it was likely that all of the projects would not be completed in the time period listed. But they also knew that other projects would take their place. Projections are made using the best information available at the time, realizing that some changes are likely. Armed with the depreciation schedule for assets on hand plus the projected depreciation expense of new projects, the staff could now project depreciation expense.

### **“Why is the operating income important?”**

Operating income is the difference between operating revenues and operating expenses. If the water and sewer system is not realizing sufficient revenues to fund operating expenses and

depreciation there is a serious financial problem. With the accounting change that makes contributed capital a current revenue, cities may find themselves showing healthy changes in net assets when, in fact, there are not enough revenues to fund expenses. Since grants and other similar monies can be used only for the capital projects they are intended to build, grants can provide no infusion of cash to pay ordinary operating expenses.

Any City anticipated receiving \$768,000 in grants in FY 2009, and the staff realized that the grants should be included in the projection. They made a note to bring operating income to the attention of the governing body.

Any City’s spreadsheet for water and sewer revenues and expenses is shown in Table 3 on page 7.

### **“How do we handle the additional debt requirements that are necessary to complete all the projects?”**

Any City’s engineer worked with city staff to develop a schedule of planned capital improvements and their estimated costs. These are shown in Table 4 on page 8. Some of the new projects would require new debt.

**Table 3. Any City — Water/Sewer Fund Financial History & Projections**

<b>Growth Rate Water = 1.00%      Growth Rate Sewer = 0.50%</b>							

**TABLE 4. ANY CITY — CAPITAL PROJECTS**

Projects	Estimated Cost	Estimated Completion
Water Line Replacement	\$1,500,000	F/Y 2009
Sewer Line Rehab	\$3,000,000	F/Y 2010
Water Line Extension	\$2,500,000	F/Y 2011
Sewer Line Extension	\$3,500,000	F/Y 2011
<b>Total</b>	<b>\$10,500,000</b>	

**“Do we have enough money to pay debt service and fund new projects?”**

The staff was ready to calculate the rate changes the city needed in order to fund operations. But an important question had to be answered first: Would the income translate into enough cash flow to meet the principal payments on debt and pay for new projects? To answer that question, staff decided to use a simplified cash flow statement, projecting the future cash needs of the water and sewer system. Table 5 shows current and projected cash flow.

**TABLE 5. ANY CITY — WATER/SEWER FUND CASH FLOW**

	Audit F/Y 2006	Audit F/Y 2007	Current F/Y 2008	Projected F/Y 2009	Projected F/Y 2010	Projected F/Y 2011
<b>INCOME (LOSS) BEFORE CONTRIBUTIONS &amp; TRANSFERS</b>			\$239,821	\$73,259	(\$396,811)	(\$560,594)
ADD:

<b>BEGINNING CASH</b>			\$902,965	\$3,634,346	\$7,066,540	\$1,427,572
<b>ENDING CASH</b>		<b>\$902,965</b>	<b>\$3,634,346</b>	<b>\$7,066,540</b>	<b>\$1,427,572</b>	<b>(\$430,769)</b>

**“Now we have lots of information. What does it tell us?”**

Once the staff completed the projections of income and cash flow, it was evident that without a revenue increase, the utility would run out of cash in a few years. By state law, water/sewer funds must produce an income. More importantly no water/sewer system can function for a long period of time while continually losing money.

As Any City’s staff looked over their numbers it was quickly apparent that the city would have to increase rates. What size increase would be needed?

The staff considered several options:

1. Implement a minimum increase sufficient to fund the current costs; determine the amount of and implement larger increase(s) later once the actual costs of capital improvements are known.

**Advantages:**

- Lessens the immediate impact to customers; and
- Rates set after the costs have been incurred obviously are based on better data than projections.

**Disadvantage:**

Enacting rate changes several times within a short period means customers’ attention will be directed to higher rates over and over again. This is likely to lead to repeated customer complaints.

2. Look at the largest year’s financial requirement (which is often the final year projected) and increase the rates enough to cover that year.

**Advantages:**

- City leaders have to significantly raise rates only once and answer all questions and complaints then; and

- Revenues in the near term years will be greater before the new debt begins so there is an opportunity to set monies aside for future use.

**Disadvantages:**

- Larger increases generally upset customers more; and
- If the projections turn out not to be as accurate as hoped additional rate increases may be needed.

3. Cut operating and maintenance costs and/or reduce the capital improvement schedule.

**Advantage:**

Rate increases may be delayed and/or reduced.

**Disadvantages:**

- Needed projects will likely be postponed;
- Customer service may suffer; and
- State and federal regulators may impose fines and other penalties for failure to make improvements.

Option 3 was quickly discarded. It was clear to staff that water/sewer rate increases were needed. Now they had to determine the size and timing of rate increases and communication strategies.

Because revenue needs were large, staff decided on a phased approach. They recommended increasing both water and sewer rates in each of the next three years. For FY 2009, water and sewer rates would each be increased by 15 percent; at the beginning of FY 2010, water rates would increase 10 percent and sewer rates 15 percent; at the beginning of FY 2011, water rates and sewer rates would each increase 5 percent. Table 6 on page 10 shows the results.

Using the projected new revenue, the finance director repeated the cash flow analysis. Table 7 shows that the rate increases will result in positive ending cash through the study period.

discussion, the governing body decided to delay a vote on rate increases for two months. They asked the city administrator to develop a communications strategy and prepare information to inform rate

**“O.K. We know how much to raise rates, how do we build support for the increases?”**

Staff developed a written report, presented a copy to each member of the governing body, and prepared a presentation for the next city council meeting. At the meeting, staff explained their findings and recommendations. After lengthy

payers about why water and sewer rate increases were needed.

As the administrator and the city’s information officer worked on this assignment, they kept in mind the following:

- The definition of an enterprise fund implies that sufficient user fees should be established to

ensure that the utility can operate on a self-sustaining basis. The major source of revenue for water and sewer funds is user fees.

- Local officials are usually reluctant to increase user fees. They may fear political backlash.
- Customers support services they value. An informed public can help. Citizens are aware that it costs more to provide safe drinking water and to clean sewage to keep rivers clean. People care about their city, the environment, and things that impact quality of life. Basically, the public is quite willing to pay a fair price for something it values. But, customers need to be informed that they're getting their money's worth.
- Elected officials and customers want efficient operations. Any City's managers knew that they had to correct some efficiency problems before implementing a rate increase. They redoubled efforts on:
  - o Accurately metering and billing all water and sewer service sales;
  - o Aggressively collecting due accounts; and
  - o Using the workforce efficiently.

Now, the administrator was ready to develop talking points.

### **What's the message?**

She prepared to answer the key question: Why are increases needed? Her information:

- Highlighted the problems detected and corrected;
- Explained I/I and water loss problems;
- Detailed the age and condition of water and sewer lines; and
- Reported on planned development and the water/sewer infrastructure needed to serve it.

The message should be honest, factual and friendly.

How do you communicate the message? Start in the work place. Turn staff into a public relations team.

All utility employees are information sources. What they say in casual comments can create a positive (or negative) image of the utility operation.

Make certain that local government leaders are informed and on board with the proposed rate increases. User fees should be easy to understand and easy for officials to explain to the public. Again, if people understand a service's value and importance, they will support and pay for it. Users will appreciate a clean, reliable water supply and effective sewage treatment that reduces diseases and provides a better environment. Help customers see the link between water/sewer service and community growth, economic development, jobs, and increased property values. Compare the cost of cable TV or cell phone services to help users understand that water/sewer services are relatively inexpensive.

Customers want to know how their rates compare with comparably sized cities and with cities in the same geographical proximity. This information is particularly important for commercial and industrial users. Be prepared to answer these concerns.

Use newspaper articles and special mailings to get the word out. Remember that the media are the eyes and ears of the community. Reporters are interested in quality of life issues. Be prepared to explain in detail why a rate increase is needed. Educate the media about water and sewer treatment. The challenge is to explain complex processes, problems, and proposed solutions in easy-to-understand terms.

### **"Success!"**

Any City followed the public information plan developed by the administrator, and the governing body successfully passed the rate increase three months later.

---

## “What’s next?”

The staff decided they couldn’t rest on success. They needed to evaluate and follow up.

How did we do? Determine how successful the program has been.

- Did we raise rates?
- Did the rates gain public support? Survey customers to find out.
- What would we do differently next time? Think about complaint calls, media coverage, and election results.

Keep a written record. Put information in the files. Don’t lose the knowledge gained. Progress is based on discovering and correcting errors and writing a history of the findings.

Keep on track. Once you’ve completed the public education campaign and raised rates, keep on track by:

- Evaluating financial operations annually and making frequent incremental water/sewer rate adjustments. Costs of labor, chemicals, power, materials, and supplies will rise. It makes sense to increase revenues proportionally.
- Continue to keep customers informed. Give periodic progress reports through press releases or in bill inserts.
- And, more important, thank customers for their continued support.

In summary, MTAS hopes that this “how to” helps you conduct utility rate studies and successfully implement rate increases. If MTAS can be of any assistance, please call.

# THE UNIVERSITY of TENNESSEE **UT**

---

## MUNICIPAL TECHNICAL ADVISORY SERVICE

The University of Tennessee does not discriminate on the basis of race, sex, color, religion, national origin, age, disability, or veteran status in provision of educational programs and services or employment opportunities and benefits. This policy extends to both employment by and admission to the university.

The university does not discriminate on the basis of race, sex, or disability in its education programs and activities pursuant to the requirements of Title VI of the Civil Rights Act of 1964, Title IX of the Education Amendments of 1972, Section 504 of the Rehabilitation Act of 1973, and the Americans with Disabilities Act (ADA) of 1990.

Inquiries and charges of violation concerning Title VI, Title IX, Section 504, ADA or the Age Discrimination in Employment Act (ADEA) or any of the other above referenced policies should be directed to the Office of Equity and Diversity (OED), 1840 Melrose Avenue, Knoxville, TN 37996-3560, telephone (865) 974-2498 (V/TTY available) or 974-2440. Requests for accommodation of a disability should be directed to the ADA Coordinator at the UTK Office of Human Resources, 600 Henley Street, Knoxville, TN 37996-4125.
