APPENDIX 17

UNIT LEVEL FORMS at the Topper Site (38AL23)
The onsite excavation protocol at Topper calls for all information pertaining to the contents of a level to be accurately recorded and documented on a unit level form, and subsequently for a plan view drawing of the level contents to be provided on graph paper. Over the course of field seasons, unit recording forms have changed and have varied in layout by year. A list of the site level form templates used at Topper over the course of the field investigations is presented in Appendix 17. Figure A17-1 illustrates the recording form utilized for the 1998 Field Season, and Figures 2- and 3 illustrate the recording forms used from 2005-2012. If features (documented in Appendix 18) were encountered during excavation they were assigned a feature number and recorded and drawn on a separate feature form (Figure A17-4). Since 2005 all features that have been encountered have been photographed and recorded using the feature form; prior to this features were recorded on the unit level forms.

APPENDIX 18

LIST OF FEATURES AT THE TOPPER SITE (38AL23)
For the purpose of this dissertation, features refer to contexts that represent either human activity or natural disturbances, differ in color or texture from the primary matrix, and may intersect multiple site strata. Features can be the byproduct of cultural or natural processes. Cultural features, by definition are non-moveable elements from archaeological sites whereby the culturally produced materials make up a part of the natural deposits. The most common human related features at Topper include post holes, hearths, middens, fire pits, and lithic concentrations. Natural features are often considered disturbances, and at Topper can include rodent burrows (faunalturbation), tree throws, burned roots, and cracks in the sediment. Natural features are not limited to Holocene deposits at Topper but can extend well into the Pleistocene Terrace as much as four meters below modern ground surface. Figure A19-7 presents examples of various disturbances identified from the Pleistocene deposits at Topper. When encountered, the excavation protocol calls for all material to be carefully recorded, mapped, and for feature fill (if present) to be screened separately.

Because natural disturbances can adversely affect cultural associations, it is important to document features when first encountered and to screen their contents separately from the remainder of the unit. At Topper, most features were treated as separate entities with regard to the contents and stratigraphy of each level. As a result, it is possible that features may cross multiple levels of excavation. To help record features properly, a feature log was implemented to allow for the documentation of features when encountered, and is presented, together with details on the major presumed cultural features from the pre Clovis deposits, in Appendix 18. As of 2012, one hundred and twenty one features have been identified at Topper, including at least 19 from the pre Clovis excavation units examined herein. In 2015, excavations resulting from a joint field school between Mississippi State University and the University of Tennessee that was
carried out on the Hillside at Topper have led to the identification of more than 100 additional features (Anderson, David G. personal communication). The majority of these features were recovered from Mississippian, Woodland and Archaic contexts.

APPENDIX 19

FEATURE AND UNRECORDED DISTURBANCES AT THE TOPPER SITE (38AL23)
While efforts at Topper were made to identify and document all features to the best of a unit supervisors’ ability, evidence from the unit level records and photographs indicates that not all features at Topper were identified or feature fill screened separately. In general, level control and piece plotting were conducted at high standards, but feature and disturbance recognition was not. According to records, prior to 2005, stains, when encountered, were not drawn on level forms with the same consistency than they were in subsequent field seasons (2005-2012). Moreover, feature fill was not as frequently screened separately from the remainder of the unit. As a result, important data regarding site integrity may have been compromised. Most errors include the inability to recognize features when initially encountered and subsequent failure to screen feature fill separately from the remainder of the unit level.

Appendix 19 includes a listing of all units and associated levels from the site that may be compromised along with a description of the disturbance. The appendix also provides a list of proveniences where disturbances were recognized but features may or may not have been assigned and/or recorded. Figure A19-2 illustrates an error whereby a stain was encountered in unit N248 E138 and the contents were not screened separately from the remainder of the unit. Under such circumstances, it is possible that a portion of the recovered materials from a given level may actually have been re-deposited from the overlying strata, and should therefore not be used in forming interpretations regarding the age of the presumed archaeological deposits. With regard to the example above, this unit was excluded from the present analysis due to the potential for artifact displacement. As preventative measure all level, feature and photograph records were consulted to assess the integrity of the recovered materials prior to the selection of units for analysis in this study. Only units with records or photographs that did not exhibit evidence of inaccuracy or error in the recording of disturbances or features were used in this study. Of the
units where disturbances were recorded, a list of the contents recovered from such disturbances is presented in Appendix 20.

Appendix 19 presents the distribution of all disturbances observed from the Holocene and Pleistocene Terrace at Topper. Disturbances include all feature and non-feature anomalies encountered over the course of excavation. Not all disturbances were recorded as Features but were however identified and recorded in the level records. The following table presents the spatial distribution of all disturbances encountered at the site between 1985 and 2012. In most cases disturbances were classified as stains, root casts, or burned organic materials. The table provides the year the disturbance was first encountered followed by provenience (unit and depth). If a feature number was not provided to the disturbance, the anomaly was designated as not recorded. Although all disturbances should be screened separately from the remaining unit, such protocol was not always followed in the field. As such, the fourth column from the right reports whether the disturbance was or was not screened separately. The following column notifies the presence or absence of associated artifacts. The last two columns inform (1) if the disturbance was mapped and (2) whether it falls within the selected study sample. A total of 381 disturbances have been identified from the Terrace at Topper and include 149 stains, 97 root casts, 73 lithic clusters, 22 pedogenic features, 19 burned areas, 6 backfill disturbances, 4 krotovina, 4 pot busts, and a cluster of shell.

Figure A19-1
Stain identified in Pleistocene Sands deposits of unit N248 140 in 2009. Stain was observed in prior levels. Sediment matrix was screened separate from the remainder of the unit, although no artifacts were observed. Although the stain was drawn and screened separate from the remainder of the level, it was not given a Feature number. Unit was included in present study.
Figure A19-2
Stain identified in Holocene deposits of unit N248 E138 98.08m in 2009. Stain was observed in prior levels; however materials collected were not screened separately from remainder of unit until present level. Material was not assigned a Feature number. Unit not selected for analysis in present study.
Figure A19-3
Map showing the spatial distribution of Feature and non-Feature disturbances from the study area at Topper. Most disturbances occur in unit N246 E140 (N=193).
Plot map showing the number and distribution of non-lithic disturbances along the East gridline at the Topper Site (38AL23) (Total disturbances =153).

Plot map showing the number and distribution of non-lithic disturbances by depth from the study area at the Topper Site (38AL23) (Total disturbances =153).
Figure A19-6
Possible disturbances identified from Pleistocene Terrace deposits at Topper. A-B are dark root casts at base of level from unit N248 E140; C and E are burned roots from unit N248 E140, D; Tap root extending from base of terrace surface. All disturbed materials from these units were screened separate from contents of remainder of level.
Types of Features at Topper. A; Stain in SW section of Quad, B; Lithic cobble cluster, C; Burned Archaic (MALA) lithic cluster, D; Pedogenic soil feature (in profile) of compacted sediment.
Table A19-2
Table showing the number and distribution of non-lithic disturbances by unit from the study area at the Topper Site (38AL23) (Total disturbances =153).

APPENDIX 21

UNIT SUPERVISORS AT THE TOPPER SITE (38AL23)
Graduate students from multiple institutions have participated in Archaeological investigations at the Topper Site, including from the University of Florida, Mississippi State University, the University of South Carolina, University of Tennessee, Texas A&M University, and Washington State University. Graduate students typically had supervisory roles and these often lead to MA Thesis or PhD Dissertation topics pertaining to some aspect of the site (Miller 2007, 2010; King 2011; Weidman 2013, Sain 2011).

Dr. Albert C. Goodyear has been the principal Investigator for the project and has made or overseen all archaeological decisions with regard to the placement and method of excavations. From 2005 to 2012, Tom Pertierra held the role of logistics coordinator. In this role, Pertierra oversaw the day to day operations at the site and provided equipment necessary for excavation, analysis, and material transport. Scientific protocol on a day-to-day basis was overseen by the Senior Science Supervisor who was in charge of all excavation in the absence of Dr. Goodyear. From 1998-2004, Kenn Steffy held the position of Senior Science Supervisor at Topper, and oversaw all excavation on the Holocene and Pleistocene Terrace at between these dates. After 2004, the role of Senior Science Supervisor was held by graduate students. Three individuals, Dr. Shane Miller (2006-2008), Dr. Ashley Smallwood (2009-2010), and Derek Anderson (2010-2012)--have held the position of Senior Science supervisor since 2005, and have been in charge of overseeing all facets of excavation on the hilltop and hillside areas of Topper. In additional to these positions, undergraduate and graduate students have also been assigned as individual unit supervisors since 2005. Prior to this date, unit supervisors were both avocationalists and professional archaeologists. A list of all unit supervisors by year is presented in appendix 21. Since From 2005-2012, the author of this dissertation, Douglas A. Sain has overseen all work.
conducted on the Holocene and Pleistocene Terrace excavations at the site, into the pre Clovis deposits.

Appendix 21 provides a year by year list of the individuals who have overseen excavation of each unit at the Topper Site. The appendix is organized with the unit coordinates and year excavated presented in the two columns to the right. The landform on which the unit is located is presented in the third column from the left, with the unit supervisors listed in the final column at right. To date, a total of 56 individuals have overseen unit excavation at Topper. Finally, a site map is provided that illustrates the locations of the test units described in the table relative to the site grid.
Figure A21-1
Map of Topper Site showing locations of excavation units. Map adapted from Miller 2011. Note: grid coordinates refer to Terrace grid system. Hillside uses an alternative grid system.

APPENDIX 22

EXCAVATION LOCATION MAPS FOR EACH FIELD SEASON AT THE TOPPER SITE (38AL23)
1998 Excavations at the Topper Site (38AL23)

Plans were originally scheduled to hold the 1998 Allendale Paleoindian Expedition at the nearby Big Pine Tree Site where ongoing research had identified a dense Archaic and Paleoindian deposit (Goodyear personal communication). However, due to recent flooding of the site as a result of abnormally high precipitation earlier in the spring it was decided that excavation would not be possible at Big Pine Tree, and Topper was subsequently chosen as an alternative field site. Because The Topper Site was slightly higher in elevation and less affected by the flooding, it was decided by the research team to resume field investigations at Topper in the summer of 1998. Similar to a field school, the program allowed participants to gain experience in archaeological excavation techniques, artifact identification, and lab analysis; all important aspects of archaeology. In addition to volunteer assistance, students could register to obtain field school credit. All funding for the project was provided from member registration fees and from volunteer donations. Funds were used to provide food for the project and to pay graduate supervisors a stipend. Graduate students from multiple institutions have participated in the project, including from the University of Florida, Mississippi State University, the University of South Carolina, University of Tennessee, Texas A&M University, and Washington State University. Graduate students typically had supervisory roles and these often lead to MA Thesis or PhD Dissertation topics pertaining to some aspect of the site (Miller 2007, 2010; King 2011; Weidman 2013, Sain 2011). The 1998 excavations include a series of 5 2x2m units oriented along the N244 grid line from E106-E130, and three additional test units to the north along the N250, N254, and N282 gridline (Figure A22-1).
Figure A22-1

Locations of 1998 Excavations at Topper. Eight 2m x 2m units; A; N282 E112, B; N254 E110, C; N244 E110, D; N244 E118, E; N24 E124, F; N244 E130, G; N250 E092, H; N244 E106. Initial Pre Clovis discovery made in unit N244 E130 (F).
1999 Excavations at the Topper Site (38AL23)

Units opened in 1999 included a 48 square meter block extending from N208 along the East 130 line to N214 E136; a 4m x 2m block excavation extending from N242 E130 to E132; and two 2m x 2m units along the Northern perimeter of the site; N268 E132, and N282 E132 (Figure A22-2). A total of 60m² of test units were opened during the 1999 field season. The ground surface of the primary 48 square meter block was measured at 98.70m with an approximate 10cm (North to South) variation in slope across the block. The entire block was leveled off to 98.40m prior to undergoing excavation in 10cm arbitrary levels.
Figure A22-2
Locations of 1999 Excavations at Topper. Above: 2x2m units N268 E132, and N282 E132, 48 square meter block beginning at N208 E130, and a 1x2m block extending from N242 E130.
2000 Excavations at the Topper Site (38AL23)

In May 2000, two new excavation blocks were opened at Topper. A 4m x 8m block was opened extending from N242 to N244 along the E128 to E136 grid lines, and a 2m x 4m block excavation was opened along the N244 grid line from E146 to E150 (Goodyear 2000). A map showing the extent of the 2000 field excavations at Topper is presented in Figure A22-3. Both of these block excavations were situated to the north of the 1999 48 square meter block excavation illustrated at the bottom of A22-3.

Figure A22-3
Locations of 2000 Excavations at Topper.
4x8 block excavation extending from N242 to N244 along the E128 to E136 grid lines at left.
Right; 2x4m block excavation along the N244 grid line from E146 to E150.
2001 Excavations at the Topper Site (38AL23)

The excavation blocks opened in 2001 include:

1. A 5m x 10m block opened up adjacent to the 4m x 8m block that was completed in 2000. This block began at the N236 E127 gridlines and extended to the northeast corner of unit N242 E137 with a 1m baulk on the south, east and west margins of the excavation.

2. A 4m x 6m block consisting of eleven 2m x 2m units placed along the E102-106 grid line from N230-N240.

3. 10 1m x 2m units that formed a U and served as a baulk on for the 5m x 10 block excavation. These units were placed on the southern, eastern and western margins of the 5m x 10m block (see Figure 4 of Appendix 22, Figure 4).

Figure A22-4

Locations of 2001 Excavations at Topper. 5x10 block excavation extending from N236 to N244 along the E128 to E138 grid lines at Right. At Left; excavations extending from N230 to N146 along the E106-108 gridline including a 4x6m block excavation.
Figure A22-5

Locations of 2002 Excavations at Topper.
5x9 block excavation extending from N240 to N244 along the E136 to E144 grid lines at Bottom. Middle; Excavation block from N267 to N269 along the E 134-136 gridline. Top; 4x6 block excavation from N284 to N286 along the E134-138 gridline.
Figure A22-6
Map showing the location of Backhoe Trench 15 excavation in 2002 at Topper Site.
Excavations at Topper in 2003 centered on three specific areas; the completion of the 2002 5x9m block to the Terrace surface, the opening of a 6m x6m block excavation, and a series of five 2m x3m units along the northern perimeter of the site between the N284 and N288 gridline (Figure A22-7). The 6m x6m block excavation is shown immediately to the South of 2002 BHT 15.
Figure A22-7
Excavations opened during the 2003 Field Season at Topper. At top; N284 E132, N286 E132, N288 E132, N288 E134, N288 E136. Center and Right; 6m x6m block extending from N270 E152 to N276 E158.
Map showing locations of excavations at Topper Site carried out during 2004 Field Season. 1; 2002-2003 pre Clovis 5m x9m block, 2; 4m x8m block from N290 E132 to N292 E138, and 3; A series of eight test units were placed on the hillside slope.

Unique grid systems implemented at Topper. 1; original Terrace grid, 2; 2004 TU grid, 3; 2005 Firebreak grid, 4; 2006-2014 Hilltop grid.
Figure A22-10
Location of 2010-2011 4m x 4m block excavation and inset pre Clovis 2m x 2m unit highlighted
Excavations at Topper to the North of the Primary 5m x9m Pleistocene Terrace block where evidence for pre Clovis chert cobble clusters have not been found.
Excavations from the primary pre Clovis block at Topper from 2000-2012. Northern Terrace highlighted in blue; Southern Terrace highlighted in red; Western Terrace highlighted in green. All excavations prior to 2004 centered on the Holocene and Pleistocene colluvial and alluvial Sands. All excavations after 2004 centered on the Pleistocene clay Terrace (with the exception of 2005 and 2010 excavations highlighted in green.)
APPENDIX 23

PROFILE AND PLAN-VIEW MAPS OF YEARLY EXCAVATIONS AT THE TOPPER SITE (38AL23)
Appendix 23 presents the vertical and horizontal distribution of mapped artifacts (by type and year of recovery) from the Topper Site. The distributions are in presented in plan–view and in profile. Where present, features are indicated by the feature designation letter “F”. The Holocene deposits range between elevations 99.50 – 98.10 m. The Clovis deposits range from 98.30 – 97.75 m, the Pleistocene Sands from 97.75 – 97.00 m, and the Pleistocene Terrace from 97.00 – 95.25 m.
Figure A23-1
Profile map showing the distribution of plotted artifacts from N242 E130-134 in 1999. Feature 48 is an Archaic biface cache. Feature 49 is a possible pre Clovis lithic cluster with associated unifaces and utilized flake. Clovis deposits located between 97.60m and 97.40m.

Figure A23-2
Plan View of Feature 49; A possible pre Clovis lithic cluster in NW corner of N242 E132 Level 15 140-150cmbs (97.150-97.05m) (Area Highlighted F49).
Profile map showing the distribution of plotted artifacts from N242-N244 E128-136 in 2000. The gap between E130-132 (Highlighted) was excavated in 1999 and thus is devoid of artifacts from the 2000 field season. Clovis deposits located between 97.75m and 97.50m. Datum elevation 98.55m.

Planview map showing the distribution of items mapped from the pre Clovis deposits from units N242-N244 E128-136 (4m x 8m block) in 2000. Highlighted areas indicate Features.
Figure A23-5
Profile map showing the distribution of plotted artifacts from the 2000 excavations of units N244-N246 E144-148 in 2000.
Figure A23-6
Planview map showing the distribution of Cobble clusters and Features from Clovis deposits in units N244-N246 E146-150 in 2000. (98.20-97.70m). Feature 62 from 98.20-98.10. Datum at 99.40m

Figure A23-7
Planview map showing the distribution of Cobble clusters and Features from pre Clovis deposits in units N244-N246 E146-150 in 2000 (97.70m – 97.20m).
Figure A23-8
Profile map showing the distribution of plotted artifacts from 2001 5x10 block excavation (N236-N240 E128-136) in 2001. Clovis deposits from 98.00-97.65. pre Clovis deposits below 97.25m. Highlighted areas are Features.
Plan view of mapped items from Archaic and Clovis deposits from 2001 5m x10m excavation block (Above) and pre Clovis deposits (Below). Features highlighted and numbered.
Figure A23-10
Plainview map showing spatial distribution of Early Archaic Feature 79 from Unit N232 E102 in the 2001 4m x 6m block excavation. Feature ranges in depth from 80-90cmbs.
Profile map showing the distribution of plotted artifacts from 2002 5m x 9m block excavation (N242-N244 E136-146) in 2002. Clovis deposits from 98.40-97.85m. Pre-Clovis deposits below 97.75m. Features Highlighted.

Planview of mapped items from Archaic and Clovis deposits from 2002 5m x 9m excavation block. Feature 85 highlighted and numbered.
Figure A23-13A
Planview of mapped items from pre Clovis deposits from 2002 5m x9m excavation block. Feature 86-88 highlighted and numbered.
Figure A23-13B
Profile map showing the distribution of plotted artifacts from 2003 5m x 9m block excavation (N242-N244 E140-144). Pre Clovis features (red) and non-feature designated lithic lusters (blue) highlighted.

Figure A23-14
Planview of mapped items from pre Clovis deposits from 2003 5m x 9m excavation block. Feature 90 Highlighted in red. Other lithic clusters not provided feature numbers highlighted in blue.
Figure A23-15

Profile map showing distribution of Woodland, Archaic and Clovis mapped artifacts by type from the 2004 4m x 6m block excavation. Units N290 E132 to N294 E136. No Features assigned from this excavation.
Figure A23-16
Profile map showing the distribution of mapped artifacts from 2011 Eastern Terrace 1m x 2m block excavation N244 E142-144-146. No artifacts were mapped west of E44.5 gridline. Paleoindian deposits consist of flakes, flake tools, hammerstones.
Figure A23-17

Top; Profile distribution of mapped artifacts from N262-N266 E144 E148 4x4m block excavation. Early Archaic and Clovis deposits between 98.30 and 98.00m. Very few bend breaks recovered from pre Clovis deposits (below 97.80m). Below; results of refit study from materials recovered from 2010-2011 4m x 4m excavation. (Refit images courtesy Derek Anderson 2011).

APPENDIX 26

ARTIFACT REFITS FROM THE STUDY SAMPLE AT THE TOPPER SITE (38AL23)
A preliminary refit analysis was conducted as an aid to establish the origin of the lithic deposits at Topper, and to evaluate whether or not site integrity has been preserved. Artifacts were examined to assess refit potentiality as encountered during the lithic attribute analysis. If refits were found among the assemblage, then I assume that their orientation and stratigraphic position within the vertical profile is either the result of human agency, or is the byproduct of natural processes. For this study, the refits that were identified were documented and examined with regard to their spatial association with other artifacts within the site grid. A total of 13 refit pairs were identified comprising 24 lithic items (Table A26-1) Of these, eleven refit pairs were classified as cultural and two were classified as the product of natural processes. Table A26-1 and Figures A26-1-4 present the results of the refit study.
Table A26-1
Artifact Refits identified from the study sample at the Topper Site (38AL23). Refits identified as encountered during the artifact attribute analysis.

Figure A26-1
Spatial distribution of artifact refits from the Study sample at Topper. Highlighted sections reflect stratigraphic zones where artifact refits are most prevalent. Shaded circles reflect natural refits. Unshaded circles reflect cultural refits. Future refit research should be conducted to demonstrate general trends in greater detail.
Figure A26-2
Chert cluster identified during 2003 5m x 9m block excavation at Topper. Cluster from unit N244 E142 level 19 (97.35-97.30). Highlighted artifacts refit to chert boulder at left. Association not assigned a feature number.
Figure A26-3
Broken chert cobble revealed in N242 E142 NW (top left) refits to cobble in N242 E142 SW Quad (bottom left). At Top left; Core with detachment scar at 96.30m. At Bottom left; Flake fragment at 96.08m that refits with core. Top right; both refits highlighted. Boulder is resting on common surface with flake detachment.
Figure A26-4
Image at top; broken chert cobble cluster revealed in N242 E142 NW quad at 95.90-95.85m from the Pleistocene Terrace. Two objects in upper left corner of quad refit. Image at bottom; a second flake refits to the cobble above it. Both flake refits resting on a common surface with associated cobbles.
APPENDIX 27

SELECTED CHERT BOULDERS COBBLES, AND CORE TOOLS FROM THE PLEISTOCENE SANDS AND PLEISTOCENE TERRACE AT THE TOPPER SITE (38AL23)
A survey of the materials recovered from the Topper Site identified at least 225 items that fit the classification of chert boulders, cobbles, and core tools. The following photographs depict a sample of these materials recovered from the pre Clovis deposits at the Topper Site. Items were recovered as 1) three dimensionally mapped piece plots, 2) items recovered from Backhoe trenches and 3) from features. All images courtesy of AL Goodyear. Two subsequent tables (Tables A27 – 1 and A27 – 2) provide provenience data as well as morphological and technological attributes of the items examined for the survey and depicted in the photographs. The frequency and distribution of platform bearing flakes at the Topper Site from a study by Goodyear and Wilkinson are presented in Tables A27 – 1a. The items illustrated below were all recovered from contexts below the Clovis deposits on the Alluvial Terrace at the Topper Site (38AL23). All data acquired by Al Goodyear and Joe Wilkins.

Figure A27 – 1

Frequency of Cores, Core tools, and tested cobbles from the pre-Clovis Pleistocene Sands at the Topper Site (38AL23). Data obtained from 1998–2008 from a 2013 study by Goodyear and Wilkinson (n.d.). (Image courtesy of Al Goodyear).
Vertical Distribution of platform bearing flakes from selected units at the Topper Site (38AL23).
Vertical Distribution of platform bearing flakes from selected units at the Topper Site (38AL23).

Figure A27 – 3

1439
Figure A27–4
Vertical Distribution of platform bearing flakes by size from unit N242 E128 at the Topper Site (38AL23).
Figure A27-5
Distribution of platform bearing flakes by size grade from unit N242 E128 at the Topper Site (38AL23). A: Archaic and Clovis, B: Upper Pleistocene Sands, C: Lower Pleistocene Sands.
Figure A27–6
Vertical Distribution of platform bearing flakes by size from unit N242 E130 at the Topper Site (38AL23).
Figure A27–7
Distribution of platform bearing flakes by size grade from unit N242 E130 at the Topper Site (38AL23). A: Archaic and Clovis, B: Upper Pleistocene Sands, C: Lower Pleistocene Sands.
Figure A27–8
Vertical Distribution of platform bearing flakes by size from unit N242 E132 at the Topper Site (38AL23).
Figure A27–9
Distribution of platform bearing flakes by size grade from unit N242 E132 at the Topper Site (38AL23). A: Archaic and Clovis, B: Upper Pleistocene Sands, C: Lower Pleistocene Sands.
Figure A27–10
Platform bearing bulb size values (x axis) by overall depth in cm (y axis) from the Topper Site.
Partial data from Al Goodyear and Joe Wilkinson.
Figure A27–11
Platform bearing bulb size values (x axis) by overall depth in cm (y axis) for unit N244 E132 at the Topper Site. Partial data from Al Goodyear and Joe Wilkinson.
Platform bearing bulb size values (x axis) by overall depth in cm (y axis) for unit N242 E132 at the Topper Site. Partial data from Al Goodyear and Joe Wilkinson.
Figure A27–13
Platform bearing bulb size values (x axis) by overall depth in cm (y axis) for unit N242 E130 at the Topper Site. Partial data from Al Goodyear and Joe Wilkinson.
Figure A27–14
Platform bearing bulb size values (x axis) by overall depth in cm (y axis) for unit N242 E128 at the Topper Site. Partial data from Al Goodyear and Joe Wilkinson.
Figure A27–15
Platform bearing bulb size values (x axis) by overall depth in cm (y axis) for unit N244 E128 at the Topper Site. Partial data from Al Goodyear and Joe Wilkinson.
Figure A27–16
River cortex size values (x axis) by overall depth in cm (y axis) for the Topper Site. Partial data from Al Goodyear and Joe Wilkinson
Figure A27–17
River Cortex quantity (x axis) by overall depth (y axis) for the Topper Site. Partial data from Al Goodyear and Joe Wilkinson.
APPENDIX 28

NUMBER OF ARTIFACTS BY UNIT AND LEVEL FOR EACH FIELD SEASON AT
THE TOPPER SITE (38AL23)

APPENDIX 29

RESULTS OF INTERPRETATION FREE ANALYSIS
Appendix 29 presents the results of the Interpretation Free Analysis. The Tables that follow show the provenience information and classification of all mapped items from the study sample, including the Holocene, Pleistocene Clovis, Pleistocene Sands, and Pleistocene Terrace. Level and artifact numbers are also provided. Items were classified according to the Interpretation free categories and include pebble, Amorphous debris, debris, flake fragment, broken flake, and flake. The Attributes used to classify each item are presented in Appendix 31.

Figure A29-1
Complete Clovis flakes (at top) and broken flakes (bottom row) from Screen N242 E138 98.20-98.10m
Figure A29-2
Complete Clovis flakes from Screen N242 E138 98.20-98.10m
Figure A29-3
A; Clovis Broken flakes and flake fragments, B; Clovis debris, C; Clovis bend break formed from a snapped flakes possibly the result of trampling. All artifacts from unit N242 E130
Figure A29-4
Complete flakes from the Pleistocene Sands. Artifacts from unit N244 E130 97.00-97.10m. Complete flakes have a striking platform, intact margins, an intact termination and a bulb of force.
Examples of weathered broken chert flakes and flake fragments from the Pleistocene Sands at the Topper Site (38AL23) Items from unit N242 E130 97.00m.
Figure A29-6
Flake fragments (top two rows) and broken flakes (Bottom row) from the Pleistocene Sands at The Topper Site (38AL23). Artifacts from unit N244 E130 97.0-97.10m.
Debris from the Pleistocene Sands at the Topper Site (38AL23). Artifacts from unit N244 E130 97.00-97.10m.
Figure A29-8
Complete Flakes from the Pleistocene Terrace at the Topper Site (38AL23).
Broken flakes and Flake fragments from the Pleistocene Terrace at the Topper Site (38AL23). Broken flake at top right does not have a well-defined bulb of force but does exhibit compression rings on exterior surface removal scars.
Figure A29-10
Debris from the Pleistocene Terrace.
Figure A29-11
Amorphous debris from the Pleistocene Terrace
Length regressed against width for mapped complete Clovis flakes from 16 2m x2m units.

Width regressed against thickness for mapped complete Clovis flakes from 16 2m x2m units.
Figure A29-14
Debris Length regressed against width for Clovis Debris interpretation free category.

R² = 0.8621

Figure 6-15
Debris Width regressed against Thickness for Clovis Debris interpretation free category.

R² = 0.567
Debris Length regressed against Width for Pleistocene Sands Debris interpretation free category.

Debris Width regressed against Thickness for Pleistocene Sands Debris interpretation free category.
